

SAML for FreePBX & PBXact

Meet Security & Compliance Demands with SSO

Navigating the complex world of enterprise security and compliance can be a challenge. Our SAML Module for Single Sign-On (SSO) simplifies the process, providing a straightforward path to centralized and secure user authentication.

Secure Single Sign-On, Simplified

Our SAML module simplifies your team's applications with a single set of trusted credentials managed by an Identity Provider (IdP). It eliminates password fatigue and reduces the risk of data breaches, instantly improving security posture for compliance.

Key Benefits for Your Organization

Centralized Authentication

Manage user access from one place at the group or individual level. When an employee leaves, their access is instantly revoked across all connected systems, simplifying de-provisioning.

Enhanced Security

Integrating with your established Identity Provider lets you leverage its security policies, including multi-factor authentication (MFA), to protect your voice applications.

Simplified User Experience

Users sign in once and gain access to their telephony tools in FreePBX and PBXact, Administrator Control Panel (ACP), User Control Panel (UCP), and Sangoma Desktop Client (SDC), without needing multiple passwords.

Built for Enterprise Compliance

Meeting audit and compliance requirements is no longer a burden. The SAML module provides the tools you need to enforce security policies and demonstrate control over user access, helping you align with standards.

Audit-ready

Generate clear logs of user sign-ins, making it easy to track access and provide evidence for auditors.

Policy Enforcement

Consistently apply your corporate security policies across all integrated applications.

Reduced Risk

Mitigate risks associated with weak or stolen passwords by relying on a single, secure authentication source.

Easy Configuration & Broad Compatibility

We designed our SAML module for easy configuration, allowing you to connect effortlessly with your existing systems, with a step-by-step setup wizard to help you copy-paste special authentication links and tokens into the right positions.

We support major Identity Providers, including:

Microsoft Azure AD

OKTA

Google Workspace
